Project Design Phase-II

Technology Stack (Architecture & Stack)

Date	29 October 2026	**Team Name**	Harshika Jain
Team ID	EN25CS3010389	**Project Name**	Global Fuel Prices and Taxation Trends

Define Your Technology Stack

Identify the technologies used for the fuel-price analytics solution. The stack below reflects a Tableau Public project with a structured dataset; no separate database or custom web application is assumed.

S.N	Component	Description	Technology	Justification / Purpose
1	Programming / Query Language	Language used to query, filter, transform, aggregate, and analyze data.	Tableau calculations; no separate Python/SQL code assumed.	Calculated fields and aggregations support price and tax analysis in the workbook.
2	Database / Data Warehouse	Place used to store and manage structured data.	Source dataset in CSV/Excel format (confirm actual file type).	Suitable for a student project and can be connected directly to Tableau Public.
3	Data Ingestion	Loads data from source files into the analysis environment.	Tableau Data Connection.	Imports the fuel-price dataset and exposes fields such as Country, Date, Region, fuel prices, and Tax Percentage.
4	Data Transformation and Business Logic	Cleans, filters, aggregates, and calculates analytical measures.	Tableau data types, filters, aggregations, and calculated fields.	Supports average fuel prices, comparisons, date trends, and tax-related analysis.
5	Data Visualization / Analytics	Creates charts, reports, KPIs, and visual analysis.	Tableau Public.	Used for bar charts, line charts, map, scatter plot, dashboard, and story.
6	Front-End / User Interface	Interface used to interact with dashboards and filters.	Tableau Public workbook/dashboard.	Users explore fuel-price comparisons through filters and tooltips; no separate Flask/Streamlit interface is assumed.
